[^0]
## What are we solving ?

Minwise hashing is widely popular for search and retrieval. Major Complaint: Document length is unnecessarily penalized.

We precisely fix this and provide a practical solution.

Other consequence: Algorithmic improvement for binary maximum inner product search (MIPS).

## Outline

- Motivation
- Asymmetric LSH for General Inner Products
- Asymmetric Minwise Hashing
- Faster Sampling
- Experimental Results.

## Shingle Based Representation

- Shingle based representation (Bag-of-Words) widely adopted.
- Document is represented as a set of tokens over a vocabulary $\Omega$.

Example Sentence : "Five Kitchen Berkley".
Shingle Representation (Uni-grams): \{Five, Kitchen, Berkeley\} Shingle Representation (Bi-grams): \{Five Kitchen, Kitchen Berkeley\}

## Shingle Based Representation

- Shingle based representation (Bag-of-Words) widely adopted.
- Document is represented as a set of tokens over a vocabulary $\Omega$.

Example Sentence : "Five Kitchen Berkley".
Shingle Representation (Uni-grams): \{Five, Kitchen, Berkeley\} Shingle Representation (Bi-grams): \{Five Kitchen, Kitchen Berkeley\}

## Sparse Binary High Dimensional Data Everywhere

- Sets can be represented as binary vector indicating presence/absence.
- Vocabulary is typically huge in practice.
- Modern "Big data" systems use only binary data matrix.

## Resemblance (Jaccard) Similarity

The popular resemblance (Jaccard) similarity between two sets (or binary vectors) $X, Y \subset \Omega$ is defined as:

$$
\mathcal{R}=\frac{|X \cap Y|}{|X \cup Y|}=\frac{a}{f_{x}+f_{y}-a}
$$

where $a=|X \cap Y|, f_{x}=|X|, f_{y}=|Y|$ and $|$.$| denotes the cardinality.$
For binary $(0 / 1)$ vector representation $\Longleftrightarrow$ a set (locations of nonzeros).

$$
a=|X \cap Y|=x^{T} y ; \quad f_{x}=\operatorname{nonzeros}(x) ; \quad f_{y}=\operatorname{nonzeros}(y)
$$

where $x$ and $y$ are the binary vector equivalents of sets $X$ and $Y$ respectively.

## Minwise Hashing (Broder 97)

The standard practice in the search industry:
Given a random permutation $\pi$ (or a random hash function) over $\Omega$, i.e.,

$$
\pi: \Omega \longrightarrow \Omega, \quad \text { where } \quad \Omega=\{0,1, \ldots, D-1\}
$$

The MinHash is given by

$$
h_{\pi}(x)=\min (\pi(x))
$$

An elementary probability argument shows that

$$
\operatorname{Pr}(\min (\pi(X))=\min (\pi(Y)))=\frac{|X \cap Y|}{|X \cup Y|}=\mathcal{R} .
$$

## Traditional Minwise Hashing Computation²

(1) Uniformly sample a permutation over attributes $\pi$ : $[0, D] \mapsto[0, D]$.
(2) Shuffle the vectors under $\pi$.
(3) The hash value is smallest index which is not zero.

| 0 | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 | 10 | 11 | 12 | 13 | 14 | 15 |

\hline
\end{array} \\
& S_{1}: 01100111001000100000
\end{aligned}
$$

$$
\begin{aligned}
& \pi\left(\mathrm{S}_{1}\right): \quad 0 \begin{array}{lllllllllllllll}
0 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0
\end{array}
\end{aligned}
$$

$$
\begin{aligned}
& \mathrm{S}_{3}: \begin{array}{llllllllllllllll}
0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0
\end{array}
\end{aligned}
$$

$$
h_{\pi}\left(S_{1}\right)=2, \quad h_{\pi}\left(S_{2}\right)=0, \quad h_{\pi}\left(S_{3}\right)=0
$$

${ }^{2}$ This is very inefficient, we recently found faster ways ICML 2014 and UAI 2014

## Traditional Minwise Hashing Computation²

(1) Uniformly sample a permutation over attributes $\pi$ : $[0, D] \mapsto[0, D]$.
(2) Shuffle the vectors under $\pi$.
(3) The hash value is smallest index which is not zero.

$$
\begin{aligned}
& \begin{array}{llllllllllllllll}
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 \\
\hline
\end{array} \\
& \begin{array}{lllllllllllllllll}
0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15 \\
\hline
\end{array}
\end{aligned}
$$

$$
\begin{aligned}
& \text { S3: } 0000100011000000010 \\
& \pi\left(\mathrm{~S}_{3}\right): 11000000000101000 \\
& h_{\pi}\left(S_{1}\right)=2, \quad h_{\pi}\left(S_{2}\right)=0, \quad h_{\pi}\left(S_{3}\right)=0
\end{aligned}
$$

For any two binary vectors $S_{1}, S_{2}$ we always have

$$
\operatorname{Pr}\left(h_{\pi}\left(S_{1}\right)=h_{\pi}\left(S_{2}\right)\right)=\frac{\left|S_{1} \cap S_{2}\right|}{\left|S_{1} \cup S_{2}\right|}=R \quad \text { (Jaccard Similarity.). }
$$

${ }^{2}$ This is very inefficient, we recently found faster ways ICML 2014 and UAI 2014

## Locality Sensitive Hashing (LSH) and Sub-linear Search

Locality Sensitive : A family (randomized) of hash functions $h$ s.t.

$$
\operatorname{Pr}_{h}[h(x)=h(y)]=f(\operatorname{sim}(x, y))
$$

where $f$ is monotonically increasing ${ }^{3}$.

## MinHash is LSH for Resemblance or Jaccard Similarity

[^1]
## Locality Sensitive Hashing (LSH) and Sub-linear Search

Locality Sensitive : A family (randomized) of hash functions $h$ s.t.

$$
\operatorname{Pr}_{h}[h(x)=h(y)]=f(\operatorname{sim}(x, y))
$$

where $f$ is monotonically increasing ${ }^{3}$.

## MinHash is LSH for Resemblance or Jaccard Similarity

Well Known: Existence of LSH for a similarity $\Longrightarrow$ fast search algorithms with query time $O\left(n^{\rho}\right), \quad \rho<1$ (Indyk \& Motwani 98)

## The quantity $\rho$ :

- A property dependent $f$.
- Smaller is better.

[^2]
## Known Complaints with Resemblance

$$
\mathcal{R}=\frac{|X \cap Y|}{|X \cup Y|}=\frac{a}{f_{x}+f_{y}-a},
$$

Consider "text" description of two restaurants:
(1) "Five Guys Burgers and Fries Downtown Brooklyn New York" \{five, guys, burgers, and, fries, downtown, brooklyn, new, york\}
(2) "Five Kitchen Berkley" \{five, kitchen, berkley\}

Search Query (Q): "Five Guys" \{five, guys\}

## Known Complaints with Resemblance

$$
\mathcal{R}=\frac{|X \cap Y|}{|X \cup Y|}=\frac{a}{f_{x}+f_{y}-a}
$$

Consider "text" description of two restaurants:
(1) "Five Guys Burgers and Fries Downtown Brooklyn New York"
\{five, guys, burgers, and, fries, downtown, brooklyn, new, york\}
(2) "Five Kitchen Berkley"
\{five, kitchen, berkley\}

Search Query (Q): "Five Guys" \{five, guys\}

Resemblance with descriptions:
(1) $|X \cap Q|=2,|X \cup Q|=9, \mathcal{R}=\frac{2}{9}=0.22$
(2) $|X \cap Q|=1,|X \cup Q|=4, \mathcal{R}=\frac{1}{4}=0.25$

Resemblance penalizes the size of the document.

## Alternatives: Set containment and Inner Product

For many applications (e.g. record matching, plagiarism detection etc.) Jaccard Containment more suited than Resemblance.

Jaccard Containment w.r.t. Q between X and Q

$$
\begin{equation*}
\mathcal{J}_{\mathcal{C}}=\frac{|X \cap Q|}{|Q|}=\frac{a}{f_{q}} . \tag{1}
\end{equation*}
$$

Some Observations
(1) Does not penalize the size of text.
(2) Ordering same as the ordering of inner products a (or overlap).
(3) Desirable ordering in the previous example.

## LSH Framework Not Sufficient for Inner Products

Locality Sensitive Requirement:

$$
\operatorname{Pr}_{h}[h(x)=h(y)]=f\left(x^{\top} y\right)
$$

where $f$ is monotonically increasing.
Theorem (Shrivastava and Li NIPS 2014): Impossible for dot products

- For inner products, we can have $x$ and $y$, s.t. $x^{\top} y>x^{\top} x$. Self similarity is not the highest similarity.
- Under any hash function $\operatorname{Pr}(h(x)=h(x))=1$. But we need

$$
\operatorname{Pr}(h(x)=h(y))>\operatorname{Pr}(h(x)=h(x))=1
$$

## LSH Framework Not Sufficient for Inner Products

Locality Sensitive Requirement:

$$
\operatorname{Pr}_{h}[h(x)=h(y)]=f\left(x^{\top} y\right)
$$

where $f$ is monotonically increasing.
Theorem (Shrivastava and Li NIPS 2014): Impossible for dot products

- For inner products, we can have $x$ and $y$, s.t. $x^{\top} y>x^{\top} x$. Self similarity is not the highest similarity.
- Under any hash function $\operatorname{Pr}(h(x)=h(x))=1$. But we need

$$
\operatorname{Pr}(h(x)=h(y))>\operatorname{Pr}(h(x)=h(x))=1
$$

For Binary Inner Products: Still Impossible

- $x^{T} y \leq x^{T} x$ is always true.
- We instead need $x, y, z$ such that $x^{T} y>z^{T} z$

## LSH Framework Not Sufficient for Inner Products

Locality Sensitive Requirement:

$$
\operatorname{Pr}_{h}[h(x)=h(y)]=f\left(x^{\top} y\right)
$$

where $f$ is monotonically increasing.
Theorem (Shrivastava and Li NIPS 2014): Impossible for dot products

- For inner products, we can have $x$ and $y$, s.t. $x^{\top} y>x^{\top} x$. Self similarity is not the highest similarity.
- Under any hash function $\operatorname{Pr}(h(x)=h(x))=1$. But we need

$$
\operatorname{Pr}(h(x)=h(y))>\operatorname{Pr}(h(x)=h(x))=1
$$

For Binary Inner Products: Still Impossible

- $x^{T} y \leq x^{T} x$ is always true.
- We instead need $x, y, z$ such that $x^{T} y>z^{T} z$

Hopeless to find Locality Sensitive Hashing!

## Asymmetric LSH (ALSH) for General Inner Products

Shrivastava and Li (NIPS 2014): Despite no LSH, Maximum Inner Product Search (MIPS) is still efficient via an extended framework

## Asymmetric LSH (ALSH) for General Inner Products

Shrivastava and Li (NIPS 2014): Despite no LSH, Maximum Inner Product Search (MIPS) is still efficient via an extended framework

## Asymmetric LSH Framework: Idea

(1) Construct two transformations $P($.$) and Q().(P \neq Q)$ along with a randomized hash functions $h$.
(2) $P(),. Q($.$) and h$ satisfies

$$
\operatorname{Pr}_{h}[h(P(x))=h(Q(q))]=f\left(x^{T} q\right), \quad \mathrm{f} \text { is monotonic }
$$

## Small things that made BIG difference

## Shrivastava and Li NIPS 2014 construction (L2-ALSH)

(1) $\mathrm{P}(\mathrm{x})$ : Scale data to shrink norms $<0.83$. Append $\|x\|^{2},\|x\|^{4}$, and $\|x\|^{8}$ to vector $x$. (just 3 scalars)
(2) $\mathrm{Q}(\mathrm{q})$ : Normalize. Append three 0.5 to vector $q$.
(3) h: Use standard LSH family for $L_{2}$ distance.

Caution: Scaling is asymmetry in strict sense, it changes the distribution (e.g. variance) of hashes.

First Practical and Provable Algorithm for General MIPS :

## A Generic Recipe : Even better ALSH for MIPS

## The Recipe:

- Start with a similarity $\mathcal{S}^{\prime}(q, x)$ for which we have an LSH (or ALSH).
- Design $P($.$) and Q($.$) , such that \mathcal{S}^{\prime}(Q(q), P(x))$ is monotonic in $q^{\top} x$
- Use extra dimensions.

## Improved ALSH (Sign-ALSH) Construction for General MIPS

$\mathcal{S}^{\prime}(q, x)=\frac{q^{\top} x}{\|q\|_{2}\|x\|_{2}}$ and Simhash ${ }^{4}$. (Shrivastava and Li UAI 2015)

|  | Sign-ALSH | L2-ALSH | Cone Trees |
| :---: | :---: | :---: | :---: |
| MNIST | $\mathbf{7 , 9 4 4}$ | 9,971 | 11,202 |
| WEBSPAM | $\mathbf{2 , 8 6 6}$ | 3,813 | 22,467 |
| RCV1 | $\mathbf{9 , 9 5 1}$ | 11,883 | 38,162 |

[^3]
## Binary MIPS: A Sampling based ALSH

Idea: Sample index $i$, if $x_{i}=1$ and $q_{i}=1$, make hash collision, else not.

$$
\begin{gathered}
\mathcal{H}_{S}(f(x))= \begin{cases}0 & \text { if } x_{i}=1, i \text { drawn uniformly } \\
1 & \text { if } \mathrm{f}=\mathrm{Q}(\text { for query }) \\
2 & \text { if } \mathrm{f}=\mathrm{P} \text { (while preprocessing) }\end{cases} \\
\operatorname{Pr}\left(\mathcal{H}_{S}(P(x))=\mathcal{H}_{S}(Q(y))\right)=\frac{a}{D}, \\
\frac{a}{D} \text { is monotonic in inner product } a .
\end{gathered}
$$

## Problems:

(1) Only informative if $x_{i}=1$, else hash just indicates query or not.
(2) Sparse data, with $D \gg f, \frac{a}{D} \simeq 0$, almost all hashes are un-informative.

## A Closer Look at MinHash

Collision Probability:

$$
\operatorname{Pr}\left(h_{\pi}(x)=h_{\pi}(q)\right)=\frac{a}{f_{x}+f_{q}-a} \gg \frac{a}{D} \simeq 0
$$

Useful: $\frac{a}{f_{x}+f_{q}-a}$ very sensitive w.r.t a compared to $\frac{a}{D}$. $(D \gg f)$ The core reason why MinHash is better than random sampling.

Problem: $\frac{a}{f_{x}+f_{q}-a}$ is not monotonic in a (inner product).
Not LSH for binary inner product. (Though a good heuristic!)

Why we are biased in favor of MinHash ? :

- SL "In defense of MinHash over Simhash" AISTATS $2014 \Longrightarrow$ For binary data MinHash is provably superior than SimHash.
- Already some hope to beat state-of-the-art Sign-ALSH for Binary Data

## The Fix: Asymmetric Minwise Hashing

Let $M$ be the maximum sparsity of the data vectors.

$$
M=\max _{x \in \mathcal{C}}|x|
$$

Define $P:[0,1]^{D} \rightarrow[0,1]^{D+M}$ and $Q:[0,1]^{D} \rightarrow[0,1]^{D+M}$ as:

$$
\begin{aligned}
& P(x)=[x ; 1 ; 1 ; 1 ; \ldots ; 1 ; 0 ; 0 ; \ldots ; 0] M-f_{x} 1 \text { s and } f_{x} \text { zeros } \\
& Q(q)=[x ; 0 ; 0 ; 0 ; \ldots ; 0], M \text { zeros }
\end{aligned}
$$

## The Fix: Asymmetric Minwise Hashing

Let $M$ be the maximum sparsity of the data vectors.

$$
M=\max _{x \in \mathcal{C}}|x|
$$

Define $P:[0,1]^{D} \rightarrow[0,1]^{D+M}$ and $Q:[0,1]^{D} \rightarrow[0,1]^{D+M}$ as:

$$
\begin{aligned}
& P(x)=[x ; 1 ; 1 ; 1 ; \ldots ; 1 ; 0 ; 0 ; \ldots ; 0] M-f_{x} 1 \text { s and } f_{x} \text { zeros } \\
& Q(q)=[x ; 0 ; 0 ; 0 ; \ldots ; 0], M \text { zeros }
\end{aligned}
$$

After Transformation:
$R^{\prime}=\frac{|P(x) \cap Q(q)|}{|P(x) \cup Q(q)|}=\frac{a}{M+f_{q}-a}$,

## monotonic in the inner product $a$

Also, $M+f_{q}-a \ll D$ ( M of order of sparsity, handle outliers separately.)
Note : To get rid of $f_{q}$ change $P($.$) to P(Q()$.$) and Q($.$) to Q(P()$.$) .$

## Asymmetric Minwise Hashing: Alternative View

$$
\begin{aligned}
P^{\prime}(x) & =\left[x ; M-f_{x} ; 0\right] \\
Q^{\prime}(x) & =\left[x ; 0 ; M-f_{x}\right]
\end{aligned}
$$

The weighted Jaccard between $P^{\prime}(x)$ and $Q^{\prime}(q)$ is

$$
\mathcal{R}_{W}=\frac{\sum_{i} \min \left(P^{\prime}(x)_{i}, Q^{\prime}(q)_{i}\right)}{\sum_{i} \max \left(P^{\prime}(x)_{i}, Q^{\prime}(q)_{i}\right)}=\frac{a}{2 M-a}
$$

Fast Consistent Weighted Sampling (CWS) to get asymmetric MinHash in $O\left(f_{x}\right)$ time instead of $O(2 M)$ where $M \geq f_{x}$.

## Asymmetric Minwise Hashing: Alternative View

$$
\begin{aligned}
P^{\prime}(x) & =\left[x ; M-f_{x} ; 0\right] \\
Q^{\prime}(x) & =\left[x ; 0 ; M-f_{x}\right]
\end{aligned}
$$

The weighted Jaccard between $P^{\prime}(x)$ and $Q^{\prime}(q)$ is

$$
\mathcal{R}_{W}=\frac{\sum_{i} \min \left(P^{\prime}(x)_{i}, Q^{\prime}(q)_{i}\right)}{\sum_{i} \max \left(P^{\prime}(x)_{i}, Q^{\prime}(q)_{i}\right)}=\frac{a}{2 M-a}
$$

Fast Consistent Weighted Sampling (CWS) to get asymmetric MinHash in $O\left(f_{x}\right)$ time instead of $O(2 M)$ where $M \geq f_{x}$.

## Alternative View:

- $M-f_{x}$ favors larger documents in proportion to $-f_{x}$, which cancels the inherent bias of minhash towards smaller set.
- A novel bias correction, which works well in practice.

## Theoretical Comparisons

Collision probability monotonic in inner product $\Longrightarrow$ asymmetric minwise hashing is an ALSH for binary MIPS.

$$
\rho_{M H-A L S H}=\frac{\log \frac{S_{0} / M}{2-S_{0} / M}}{\log \frac{c S_{0} / M}{2-c S_{0} / M}} ; \quad \rho_{S i g n}=\frac{\log \left(1-\frac{1}{\pi} \cos ^{-1}\left(\frac{S_{0}}{M}\right)\right)}{\log \left(1-\frac{1}{\pi} \cos ^{-1}\left(\frac{c S_{0}}{M}\right)\right)}
$$

## Theoretical Comparisons

Collision probability monotonic in inner product $\Longrightarrow$ asymmetric minwise hashing is an ALSH for binary MIPS.

$$
\rho_{M H-A L S H}=\frac{\log \frac{S_{0} / M}{2-S_{0} / M}}{\log \frac{c S_{0} / M}{2-c S_{0} / M}} ; \quad \rho_{S i g n}=\frac{\log \left(1-\frac{1}{\pi} \cos ^{-1}\left(\frac{S_{0}}{M}\right)\right)}{\log \left(1-\frac{1}{\pi} \cos ^{-1}\left(\frac{c S_{0}}{M}\right)\right)}
$$

Asymmetric Minwise Hashing is significantly better than Sign-ALSH (SL UAI 2015) (Expected after SL AISTATS 2014)

## Complaints with MinHash: Costly Sampling

$$

$$
h_{\pi}\left(S_{1}\right)=2, \quad h_{\pi}\left(S_{2}\right)=0, \quad h_{\pi}\left(S_{3}\right)=0
$$

Process the entire vector to compute one minhash $O(d)$.

- Search time is dominated by the hashing query. $O(K L d)$
- Training and Testing time dominated by the hashing time. $O(k d)$

Parallelization possible but not energy efficient. (LSK WWW 2012)

## Complaints with MinHash: Costly Sampling

$\begin{array}{llllllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14 & 15\end{array}$

$\mathrm{S}_{2}: 010010 \begin{array}{lllllllllll}0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 1\end{array} 0$
$S_{3}: \begin{array}{llllllllllllllll}0 & 0 & 0 & 1 & 0 & 0 & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0\end{array}$

$$
\begin{array}{lllllllllllllllll}
\pi\left(\mathrm{S}_{1}\right): & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\
\pi\left(\mathrm{~S}_{2}\right): & 1 & 0 & 0 & 1 & 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 0 \\
\pi\left(\mathrm{~S}_{3}\right): & 1 & 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 0 & 0
\end{array}
$$

$$
h_{\pi}\left(S_{1}\right)=2, \quad h_{\pi}\left(S_{2}\right)=0, \quad h_{\pi}\left(S_{3}\right)=0
$$

Process the entire vector to compute one minhash $O(d)$.

- Search time is dominated by the hashing query. $O(K L d)$
- Training and Testing time dominated by the hashing time. $O(k d)$

Parallelization possible but not energy efficient. (LSK WWW 2012)
Storing only the minimum seems quite wasteful.

## Solution: One Pass for All hashes

1. Sketching: Bin and compute minimum non-zero index in each bin.

|  | $\mid$ |
| :--- | :--- |
| $\pi\left(S_{1}\right)$ | 000001010000001110100110 |
| $\pi\left(S_{2}\right)$ | 000001110000101011000000 |

## Solution: One Pass for All hashes

1. Sketching: Bin and compute minimum non-zero index in each bin.

|  | Bin 0 | Bin 1 | $\operatorname{Bin} 2$ | $\operatorname{Bin} 3$ | $\operatorname{Bin} 4$ | $\operatorname{Bin} 5$ |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: |

- $\operatorname{Pr}\left(\mathcal{H}_{j}\left(S_{1}\right)=\mathcal{H}_{j}\left(S_{2}\right)\right)=R$ for $i=\{0,1,2 \ldots, k\}$
- $O(d+k)$ instead of traditional $O(d k)$ !

## Speedup

Figure: Ratio of old and new hashing time indicates a linear time speedup

## Datasets and Baselines

Table: Datasets

| Dataset | \# Query | \# Train | \# Dim | nonzeros (mean $\pm$ std) |
| :--- | ---: | ---: | ---: | :---: |
| EP2006 | 2,000 | 17,395 | $4,272,227$ | $6072 \pm 3208$ |
| MNIST | 2,000 | 68,000 | 784 | $150 \pm 41$ |
| NEWS20 | 2,000 | 18,000 | $1,355,191$ | $454 \pm 654$ |
| NYTIMES | 2,000 | 100,000 | 102,660 | $232 \pm 114$ |

## Competing Schemes

(1) Asymmetric minwise hashing (Proposed)
(2) Traditional minwise hashing (MinHash)
(3) L2 based Asymmetric LSH for Inner products (L2-ALSH)
(9) SimHash based Asymmetric LSH for Inner Products (Sign-ALSH)

## Actual Savings in Retrieval

## Ranking Verification

## Conclusions

- Minwise hashing has inherent bias towards smaller sets.
- Using the recent line of work on asymmetric LSH, we can fix the existing bias using asymmetric transformations.
- Asymmetric minwise hashing leads to an algorithmic improvement over state-of-the-art hashing scheme for binary MIPS .
- We can obtain huge speedups using recent line of work on one permutation hashing.
- The final algorithm performs very well in practice compared to popular schemes.
